

REVILAB ML 08 - peptide preparation for the female body

	❖ Peptides ❖ Revilab peptides ❖ Revilab ML 08 – for the female body
	Vendor code: 61518
	BUY REVILAB ML 08
Description	
Revilab Peptide ML — a line of anti-aging multifunctional preparations. Revilab Peptide ML is a multifunctional preparation of a new generation aimed at slowing down the aging processes, maintaining a normal level of metabolic processes, preventing various pathologies, rehabilitation after serious illnesses, the uniqueness of which lies in the principle of the all-in-one action. Effective action of Revilab Peptide ML is due to the high-tech formula: each of the 9 preparations contains a number of synthesized peptides that have a faster effect on various body systems, triggering the function of restoring internal organs, unique plant components that have powerful antioxidant and anti-age effects and vitamin complexes, They play an important role in maintaining the optimal functioning of immunity.	
Purpose:	
• for normalization of the neuroendocrine system • for normalization of all cyclic processes in the body • to normalize the reproductive system and increase fertility • for delaying and smoothing manifestations of menopause • for the prevention of cancer • with arterial hypertension, atherosclerosis of vessels, with angiopathy • to prevent impairment of the functions of the urinary system, especially in the climacteric and in the elderly	
Ingredients	
MCC (carrier), capsule (gelatin, HPMC, food titan dye dioxide), arginine, polyunsaturated fatty acids omega-3 (alpha-linoleic acid, contains medium sorbitol and maltodextrin),	

dextrose (carrier), lactose (filler), resveratrol, peptide complex AA-1 (tetrapeptide consisting of L-alanine, L-glutamic acid, L-aspartic acid and L-glycine), peptide complex AA-7 (tripeptide consisting of L-lysine, L-glutamic acid and L-aspartic acid) peptide complex AA-9 (tripeptide consisting of L-alanine, L-glutamic acid and L-aspartic acid) peptide complex AA-13 (a dipeptide comprising L-glutamic acid and L-aspartic acid), silicon dioxide (Flowing agent).

Main components

- Peptide of epiphysis (peptide complex AA-1)

It has selective action on the gland cells, regulates the synthesis of melatonin and improves the function of the neuro-endocrine system.

- Peptide of the vascular wall (peptide complex AA-7)

It regulates metabolic processes in the vascular wall. It can increase the elasticity of blood vessels and also can decrease the risk of damage to the vessel wall, bleeding and thrombogenicity. Peptide complex AA-7 improves blood circulation of organs and tissues.

- Peptide of cartilage (peptide complex AA-9)

It has biological activity which is manifested in normalization of metabolism in bone and cartilaginous tissues.

- Peptide of urinary bladder (peptide complex AA-13)

It has biological activity which normalizes the urination, restores the metabolism in cells of urinary bladder wall, stimulate the muscle tone of detrusor and sphincter.

- Resveratrol

Resveratrol (Resveratrol (3,5,4-trigidrostilben)) - is a phytoalexin, one of the major components of the extract of red wine. White grapes and white wines contain little resveratrol. Like all polyphenols, resveratrol - a powerful antioxidant activity which is superior to vitamin E. Resveratrol exhibits estrogenic activity by binding to the same receptors as estradiol, one of the main human estrogen. In contrast to estradiol and dietilstilbestrona that accelerate the development of a number of hormone-dependent tumors and the excess of which is associated with an increased risk of developing breast cancer, resveratrol exhibits multifaceted antitumor effect. Experiments show that it inhibits ribonucleotide reductase and inhibit DNA synthesis mammals by blocking directly tumor cell multiplication. Another mechanism of antitumor action of resveratrol is its competition with estradiol for binding sites on the receptor, which reduces the stimulating effect of estradiol on cell hormone dependent tumors. Like all the phytoestrogens, resveratrol may reduce the risk of osteoporosis, which is often caused by a drop in estrogen levels in women during menopause. The same beneficial effect of resveratrol on the skin by stimulating the synthesis of collagen and preventing it from cross-linking. This effect is explained by the combined antioxidant and estrogenic effects resveratrol. Experimental study received and cardioprotective properties of red wine. It was found that the grape juice and red wine making low density lipoproteins extremely resistant to oxidation under conditions in vitro. Since the oxidation of low density lipoproteins in the blood is a major cause of atherosclerosis, grape polyphenols to prevent such oxidation, should substantially reduce the risk of cardiovascular diseases. Resveratrol - a regulator of fat metabolism in the body. Atherosclerosis of blood vessels associated with the intake of fat food, their absorption in the gastrointestinal tract, the concentration of lipid (cholesterol and triglyceride) in blood plasma deposition and penetration of products of oxidation of lipoprotein (fat + protein) in the blood vessel wall, followed by adhesion of platelets and plaque formation. This leads to

a narrowing of the lumen of blood vessels of the heart muscle, brain and other organs.

- L-arginine

Many people want to improve their sex lives and talk openly about the problems relating to it. Statistics show that only a quarter of the world's women have orgasms, and almost half do not experience sexual satisfaction. Orgasm - is not just a pleasure. It is known that regular orgasm prevents stagnation of blood in the pelvic organs, resulting in the reproductive system to normal. It is proved that women do not have orgasms, develop a huge number of diseases. For nearly a decade on the market presence of the product, and drugs that increase the potency. And more and more women are asked to release the product for them.

The amino acid L-arginine - the source and the precursor of nitric oxide. This amino acid is necessary for normal functioning of the pituitary gland. The biological effect of L-arginine: detoxifying, anti-atherosclerotic, vasodilator, improves coronary blood circulation, improves the rheological properties of blood, promotes the preservation of muscle tissue, expressed immunomodulatory, lipotropic, regulates the level of glucose in the blood, contributing to orgasm for women, restores the structure of bone, restorative and healing wounds, stimulates the production of growth hormone, hepatoprotective.

L-Arginine is also needed in the following situations: the need for raising the level of psycho-physical activity and endurance, delay in growth and development, diabetes, arthritis, bone fractures, sprains and tendon, a variety of injuries, rehabilitation after operations, immunodeficiency, AIDS, the need for improving sexual function and getting more pleasure from sexual intercourse for men and women, the prevention of cancer, and others.

- Polyunsaturated fatty acids Omega-3

Omega-3 - is polyunsaturated fatty acids (alpha-linolenic, eicosatrienoic, eicosapentaenoic acid and other). Reduces the content in the body of cholesterol, triglycerides and low-density lipoprotein, inhibit the development of atherosclerosis, cardiovascular and rheumatic diseases, thrombosis, and normalize metabolic processes.

Directions

Adults 1 tablet a day during mealtimes. Duration 4-6 weeks. If necessary, you can repeat. Possible re-receptions throughout the year.

Form release:

30 capsules of 0,35 g.

Production

Scientific and Production Center of Revitalization and Health

St. Petersburg University of Bioregulation and Gerontology
